Lemma 1 (Itô's construction of a Lévy process)

$$Y(B) = \sum_{j \ge 1} [L_j(B) - E(L_j(B))] + L_0(B)$$

is an "independently scattered random measure" with $Y(B)\sim S_lpha(\sigma|B|^{1/lpha},meta,\mu|B|)$

 $\beta = p - q$; $\sigma > 0, \mu \in \mathbb{R}$ are constants depending on α .

The $\alpha\text{-stable}$ Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

Lemma 1 (Itô's construction of a Lévy process)

$$Y(B) = \sum_{j \ge 1} [L_j(B) - E(L_j(B))] + L_0(B)$$

is an "independently scattered random measure" with $Y(B)\sim \mathcal{S}_lpha(\sigma|B|^{1/lpha},m{eta},\mu|B|)$

 $\beta = p - q$; $\sigma > 0, \mu \in \mathbb{R}$ are constants depending on α . Definition

 $Z = \{Z(B) = Y(B) - \mu | B |; B \in \mathcal{B}_b(\mathbb{R}_+ \times \mathbb{R}^d)\}$

is an α -stable Lévy noise (or α -stable random measure).

The $\alpha\text{-stable}$ Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

The case $\alpha < 1$:

$$\mu|B| = -|B| \int_{|z| \le 1} z\nu_{\alpha}(dz) = -\sum_{j \ge 1} E(L_j(B))$$
$$Z(B) = \sum_{j \ge 0} L_j(B) =: \int_{B \times (\mathbb{R} - \{0\})} zN(dt, dx, dz)$$

The case $\alpha > 1$:

$$\mu|B| = |B| \int_{|z|>1} z\nu_{\alpha}(dz) = E(L_0(B))$$

$$Z(B) = \sum_{j\geq 0} [L_j(B) - E(L_j(B))] =: \int_{B \times (\mathbb{R} - \{0\})} z\widehat{N}(dt, dx, dz)$$

Proposition 1.

The set of bounded simple processes is dense in $(\mathcal{L}_{\alpha}, \|\cdot\|_{\alpha})$.

The α -stable Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

Extending the integral to \mathcal{L}_{lpha}

Proposition 1.

The set of bounded simple processes is dense in $(\mathcal{L}_{\alpha}, \|\cdot\|_{\alpha})$.

Fix $X \in \mathcal{L}_{\alpha}$

By Proposition 1, $\exists (X_n)_n$ simple processes such that $||X_n - X||_{\alpha} \to 0$. By **Theorem 1** (maximal inequality),

$$|I(X_n)(\cdot,B) - I(X_m)(\cdot,B)||_{\alpha,T}^{\alpha} \leq c_{\alpha} ||X_n - X_m||_{\alpha,T,B}^{\alpha} \rightarrow 0,$$

as $n, m \to \infty$, where

$$\|Y\|_{lpha,T}^{lpha} = \sup_{\lambda>0} \lambda^{lpha} P(\sup_{t\leq T} |Y(t)| > \lambda)$$

The $\alpha\text{-stable}$ Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

$$\Rightarrow \exists$$
 a random element $I(X)(\cdot,B)$ in $D[0,T]$ such that

$$P(\sup_{t\leq T}|I(X_n)(t,B)-I(X)(t,B)|>\lambda)\to 0$$

For any $B\in \mathcal{B}_b(\mathbb{R}^d)$, we write

$$I(X)(t,B) = \int_0^t \int_B X(s,x)Z(ds,dx)$$

Lemma 2 Theorem 1 holds for any $X \in \mathcal{L}_{\alpha}$.

The α -stable Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

The case $B = \mathbb{R}^d$

Let X be a predictable such that

$$E\int_0^T\int_{\mathbb{R}^d}|X(t,x)|^{lpha}dxdt<\infty\quad orall T>0$$

Then $I(X)(\cdot, \mathbb{R}^d)$ is defined as the limit in probability of $\{I(X)(\cdot, E_k)\}_{k\geq 1}$ in D[0, T] equipped with the sup-norm, where $E_k \in \mathcal{B}_b(\mathbb{R}^d)$ with $E_k \uparrow \mathbb{R}^d$. We have:

 $\sup_{\lambda>0} \lambda^{\alpha} P(\sup_{t\leq T} |I(X)(t, \mathbb{R}^d)| > \lambda) \leq c_{\alpha} E \int_0^T \int_{\mathbb{R}^d} |X(t, x)|^{\alpha} dx dt$

The α -stable Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

The non-linear equation

 σ is a Lipschitz function. We consider the SPDE:

$$Lu(t,x) = \sigma(u(t,x))\dot{Z}(t,x) \quad t > 0, x \in \mathcal{O}$$
(2)

Definition

A predictable process $u = \{u(t, x); t > 0, x \in \mathcal{O}\}$ satisfying:

$$u(t,x) = \int_0^t \int_{\mathcal{O}} G(t-s,x,y)\sigma(u(s,y))Z(ds,dy) \quad \text{a.s.}$$

for all $t > 0, x \in O$ is called a *solution* of (2) with zero initial conditions and Dirichlet boundary conditions.

The $\alpha\text{-stable}$ Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

The main result

Theorem 2 (B. 2013)

Suppose that $\mathcal{O} \subset \mathbb{R}^d$ is a bounded domain and $\forall T > 0$

$$\lim_{h \to 0} \int_0^T \int_{\mathcal{O}} |G(t, x, y) - G(t + h, x, y)|^p dy dt = 0$$
 (3)

$$\lim_{h \to 0} \int_0^T \int_{\mathcal{O}} |G(t, x, y) - G(t, x + h, y)|^p dy dt = 0$$
 (4)

$$\int_0^T \left(\sup_{x \in \mathcal{O}} \int_{\mathcal{O}} G(t, x, y)^p dy \right) dt < \infty$$
 (5)

for some $p > \alpha$ with p < 1 if $\alpha < 1$, or $p \le 2$ if $\alpha > 1$. Then equation (2) has a solution u. Moreover, \exists stopping times $\tau_K \uparrow \infty$ a.s. such that for any T > 0 and $K \ge 1$

 $\sup_{t\leq T}\sup_{x\in\mathcal{O}}E(|u(t,x)|^p\mathbf{1}_{\{t\leq\tau_{\mathcal{K}}\}})<\infty.$

The $\alpha\text{-stable}$ Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times Example: Heat equation ($\mathcal{O} \subset \mathbb{R}^d$ bounded) $G(t, x, y) \leq \overline{G}(t, x - y)$ where

$$\overline{G}(t,x) = \frac{1}{(2\pi t)^{d/2}} \exp\left(-\frac{|x|^2}{2t}\right)$$

$$\sup_{x\in\mathcal{O}}\int_{\mathcal{O}}G(t,x,y)^{p}dy\leq\int_{\mathbb{R}^{d}}\overline{G}(t,y)^{p}dy=ct^{(1-p)d/2}$$

Condition (5) holds if

$$p < 1 + \frac{2}{d}$$

Conditions (3) and (4) hold by the continuity of G

The α -stable Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times Define a truncated noise Z_K (remove from Z the jumps which exceed a value K) and a stochastic integral with respect to Z_K for which one has a p-moment inequality
 Solve equation (2) with noise Ż_K (instead of Ż) yielding a solution u_K(t, x)

3 Show that for any $t > 0, x \in \mathcal{O}, L > K$

Steps of the proof of Theorem 2:

$$u_{K}(t,x) = u_{L}(t,x)$$
 a.s. on $\{t \leq \tau_{K}\}$

for some stopping times $\tau_K \uparrow \infty$ as $K \to \infty$. Show that the process $u(t,x) = u_K(t,x)$ on $\{t \le \tau_K\}$ is a solution of (2)

1. The truncated noise: the case $\alpha < 1$

The α -stable Lévy noise

SPDFs with

α-stable Lévy noise

The linear equation

The stochastic integral

The non-linear equation

The truncated noise The equation with truncated noise The stopping times

$$egin{split} Z_{K}(B) &= \int_{B imes \{0 < |z| \le K\}} z \mathcal{N}(dt, dx, dz) \ E(e^{iu Z_{K}(B)}) &= \exp\left\{ |B| \int_{|z| \le K} (e^{iu z} - 1)
u_{lpha}(dz)
ight\} \end{split}$$

Lemma 3 (tail behavior: Giné and Marcus, 1983)

$$\begin{array}{ll} P(|Z_{\mathcal{K}}(B)| > \lambda) &\leq c_{\alpha}|B|\lambda^{-\alpha} \quad \text{for all} \quad \lambda > 0 \\ P(|Z_{\mathcal{K}}(B)| > \lambda) &\leq c_{\alpha}' \mathcal{K}^{1-\alpha}|B|\lambda^{-1} \quad \text{for all} \quad \lambda > \mathcal{K} \end{array}$$

Consequently, $E|Z_{\mathcal{K}}(B)|^{p} \leq C_{\alpha,p}\mathcal{K}^{p-\alpha}|B|$ for all $p \in (\alpha, 1)$.
